

Gloves With Enhanced Grip

Molnlycke Health Care introduces two new surgical gloves featuring enhanced grip to its Biogel® non-latex polyisoprene (PI) line. The new Biogel® PI UltraTouch® G is typically 15 percent thinner than Biogel® PI and offers improved sensitivity, a curved finger and a micro-roughened surface. The Biogel® PI UltraTouch® M (shown) features a textured surface with a straight finger. Features of the gloves include:

- A specialized manufacturing process allowing for extra grip and control.
- The fit, feel and comfort of natural rubber latex while eliminating the possibility of glove-related latex protein sensitization because they are made from a synthetic elastomer.
- Recommended for a range of surgical procedures or surgeries where latex allergies are a concern for patients or clinicians.
