

# Camera Controller For MIS Procedures

CareFusion offers the EnView™, a device used to hold and maneuver an endoscope allowing surgeons a clear and stable view of the anatomy during laparoscopic surgery. The CareFusion EnView provides camera stability and helps eliminate challenges related to manually holding endoscopes, such as fatigue, hand tremors and miscommunication.

The device accommodates 5mm and 10mm endoscopes and integrates with a hospital's existing visualization equipment. Its clamping system provides flexibility of placement with little or no interference with other working ports and its one-handed endoscope removal allows for easy cleaning. The EnView uses hydraulic technology and operates without the need for electricity or software.
