

Brain Monitoring Technology

Covidien exhibited new medical technologies and showcased some of its most-innovative products at ANESTHESIOLOGY 2010. One of the products included Nellcor™ BIS™ Brain Monitoring technology. According to the company, the Nellcor Bispectral Index (BIS) brain monitoring technology helps provide an insight into the patient-specific effects of anesthesia on the brain. By monitoring a patient's level of consciousness, BIS technology helps clinicians determine and administer the precise amount of drug to meet the needs of each individual patient, providing significant benefits for patients and healthcare institutions.
