Antibiotic-Impregnated Catheters

Responding to increased demand for technology to help prevent potentially fatal catheter-related bloodstream infections (CRBSIs), Cook Medical has expanded its Spectrum Turbo-Ject line of antibiotic impregnated peripherally inserted central venous catheters (PICCs) to treat a wider range of patient needs. For the first time, the clinical benefits of minocycline and rifampin-impregnated PICCs, a critical component[1] in eliminating 250,000 potentially fatal CRBSIs in the U.S. annually, are now available in 3 French single and 6 French triple lumen sizes.

By offering this full line of antibiotic-impregnated PICCs with a range of contrast media flow rates required for CT scans, Cook Medical is demonstrating continued dedication to empowering nurses to provide quality patient care. Spectrum technology’s proven ability to help prevent CRBSIs1 means that patients receiving the Spectrum Turbo-Ject will gain added protection from potentially deadly CRBSIs.

With the expansion of the Spectrum Turbo-Ject product line, clinicians can choose from multiple new catheter configurations, including a larger range of sizes, to meet patient needs:

- Maximum pressure limit settings of 325 psi
- 3 French single lumen with a maximum flow rate of 2 mL/second
- 4 French single lumen with a maximum flow rate of 4 mL/second
- 5 French double lumen with a maximum flow rate of 5 mL/second
- 5 French single and 6 French triple lumen with a maximum flow rate of 7 mL/second, the highest flow rates on the market
- 40, 50 and 60 cm lengths available

Numerous peer-reviewed publications, including a landmark study published in the New England Journal of Medicine, have demonstrated both the safety and efficacy

of Spectrum technology in preventing the more than 250,000 CRBSIs developed each year.[2] Spectrum technology has been shown to establish zones of inhibition greater than 15 mm for up to 70 days against the leading cause of CRBSIs. Every day, up to 171 people die in the United States from these systemic infections which average $34,508 to $56,000 to treat per infection, making CRBSI prevention a major patient safety and health care cost reduction issue.[3]

Cook Spectrum catheters work synergistically to provide broad spectrum protection against gram positive and gram negative organisms in both short- and long-term use. Additionally, research has demonstrated that use of these catheters does not promote the growth of antibiotic-resistant strains of bacteria in patients receiving Spectrum catheters. In fact, the use of Spectrum technology has demonstrated reduced antibiotic-resistant strains in one single-center study.[4]

The Cook Spectrum Turbo-Ject will be complimented by the new PICC Procedural Tray, which contains all of the components needed to streamline placement of PICCs bedside or in the interventional radiology lab. The tray provides the components for maximal sterile barrier precautions, a significant part of patient safety and infection control. The tray updates will meet the Joint Commission's 2010 National Patient Safety Goals.
