

Non-Invasive Cooling And Warming

The Philips InnerCool STx Surface Pad System for cooling and warming provides a solution with an advanced pad design for non-invasive temperature modulation therapy. With an intuitive user interface and a choice of manual or automatic modes, the STx Surface Pad System can be initiated in the Emergency Room, Intensive Care Unit, or Cath Lab by trained caregivers. The console's compact footprint makes it easy to move through the hospital. The STx Surface Pad System uses an easy-to-apply surface vest and thigh pads. With no adhesives contacting the skin, there is less risk of skin irritation. Yet, the pads provide tight skin contact for effective cooling and warming.
