

Equipment Management System

BERCHTOLD Corporation introduces the TELETOM boom, which has been re-engineered as a system of interchangeable modules that provides 360° configurability at purchase as well as exchange on-site should equipment needs change over the life of the boom. According to the company, features include:

- An exchangeable module design permitting gas, electric and low voltage outlets to be positioned anywhere on the boom with virtually no limitations.
- The ability to be configured in variable vertical and/or horizontal footprints, allowing the facility to design the boom based on space and clinical requirements without being restricted to pre-manufactured configurations.
- Conform™ shelving that has been redesigned to be width and depth adjustable, in addition to vertical sliding placement along the boom's VersaMount™ rail system, which serves as an attachment point for more than 400 accessories.
