

Content Management & Delivery System

Sony's OPSIGATE is a comprehensive web-based content management and delivery system that enables easy and secure access to shared surgical video, stills and documents throughout a hospital network. This video management system archives, organizes and distributes all digital content, without taxing a hospital's bandwidth.

The OPSIGATE system provides an efficient, economical way for medical professionals to share visual content for education, training, research and consultations. The system is fully scalable and can be expanded as the facility's storage needs grow and become more complex. Supporting HD or SD technology, it offers immediate access to surgical images and gives doctors who are off site access to the network archive from wherever they may be.

By working in tandem with the HVO-1000MD HD Blu-ray™ Medical Recorder, the system creates a seamless enterprise recording and retrieval system for the OR. The HVO-1000MD records the surgical video and automatically sends it to the OPSIGATE system, allowing clinicians to access, view, organize and distribute the surgical video to other patient care stakeholders immediately.
