

Tankless Water Heater Improves Sterilization Process Temperature Control

Keltech, Inc., a manufacturer of energy efficient electric tankless water heaters for commercial and healthcare applications, introduces the L and HL Series. This innovative technology allows water to be heated and dispensed on-demand.

The L and HL series models can accomplish most fluid heating applications that require water flow from .15 to 6 gallons per minute. Hot water on demand up to 180° F and precise temperature control can eliminate the need for overheating water to kill Legionella. Tankless water heaters are also great for booster heating in healthcare, laboratories, and testing facilities.
