## 3M DuraPrep Surgical Solution

3M DuraPrep Surgical Solution is a patient skin prepping solution that uses iodine povacrylex and isopropyl alcohol as two active ingredients and does not contain povidone-iodine. All procedures and control used for the manufacturing and testing of 3M DuraPrep Surgical Solution have been fully reviewed and approved by the FDA and comply with all FDA requirements.

3M DuraPrep Surgical Solution eliminates the need for a time-consuming scrub and paint application by combining two proven, broad-spectrum antimicrobial agents: alcohol, for fast kill and fast drying, and iodine povacrylex, for persistence in a water-insoluble film. 3M DuraPrep Surgical Solution is effective in a single painted coat, providing ease and quickness of use in a self-contained applicator. The paint-on application of 3M DuraPrep Surgical Solution differentiates this product from other surgical preparation solutions on the market that require a scrubbing technique and often result in multiple applicators and higher component costs to health providers.
