

High Alert Line Tracing Labels

Line Tracing Labels from Medi-Dose/EPS make it easy to label and trace IV lines for any medication in any setting (hospital, home, clinic). Pharmacy simply places the entire label on an IV infusion container. When the medication is administered at the bedside, nursing applies one line label to each end of the tubing. This facilitates easy line traces, improves accuracy and helps minimize IV line confusion.

A series of new labels, calling attention to routes of administration have been added to the company's growing product line. Attention can now be called to Intrathecal Lines, Arterial Lines, Central Lines, Emergency Drug Ports and Feeding Tubes. Plus, additional line tracing labels have been developed for a wide variety of commonly used but potentially dangerous meds (e.g. Fentanyl, Nitroglycerin, Dopamine, Vecuronium to name just a few). And, new general High Alert Line Tracing labels have been created for those meds not already covered by the company's existing preprinted ones. In addition, a customizable Line Tracing Label, available for laser or thermal printers, lets pharmacists and nurses create their own formats to meet their specific needs.
