

## RF Assure Detection System

The RF Assure Detection System from RF Surgical Systems is the next generation platform of the RF Surgical Detection System. The RF Assure Detection System prevents and detects a serious and costly surgical error – a retained surgical item (RSI), such as a surgical sponge or gauze, from remaining inside a patient after surgery. RF Assure features an automatic detection mat for “hands-free” patient scanning, an easy-to-operate touchscreen color display and a powerful processor to enable faster, accurate and reliable scanning while promoting staff confidence and compliance. OR staff can scan patients with a wave of the Blair-Port Wand® component of the RF Surgical Detection System™ to confirm manual counting protocol while quickly rectifying miscounts.
