

Cerebral Stethoscope

ProTron Technologies announces a new approach to early detection of aneurysms in vascular systems through the patented Stethotron® Cerebral Stethoscope. In 50 percent of ruptured aneurysms, patients in the age group of 35-60 die within minutes. One of the major factors leading to aneurysm is vascular atherosclerosis. Without invasive procedures, doctors, using the Stethotron Cerebral Stethoscope, can now quickly and easily detect the atherosclerotic changes leading to cerebral aneurysms before acute symptoms appear, when it may be too late and is costly to treat.

For more information and to sample audible detection with the Stethotron, visit www.stethotron.com [1].
