Patient Positioning System

MHP's Patient Positioning System (PPS) was created with three functions in mind: patient safety, making the placement of the catheter faster, easier and safer and to eliminate the need for the nurse to hold the patient allowing the nurse to focus on more critical required services. The PPS has a small footprint, is mobile, has total locking casters, features a built-in IV pole, storage basket, medical gel for the face and armrests, is C-Arm friendly, easy to clean, has no pinch points and in approximately 20 seconds can safely position a patient weighing up to 650 lbs.
