FMwand

Domain Surgical's FMwand is ideal for use in neurosurgery, spine surgery, cardiothoracic, and other subspecialties that require dissection near delicate tissue structures. The FMwand uses ferromagnetic heating to uniformly heat a small, looped wire (similar in shape to the end of a paperclip) at the end of the hand piece. The uniform heating effect of the FMwand tip effectively "sears" the tissue surface without delivering unnecessary energy deep into the tissue.
