ZeroWire

NDS Surgical Imaging offers the ZeroWire, which provides a wireless video link in the modern surgical OR. Utilizing the Ultra-wideband (UWB) frequency spectrum between 3.1 to 4.8 GHz, ZeroWire avoids interference with and from other devices. Designed for minimally invasive surgery and interventional procedures, ZeroWire allows surgical staff to view full HD surgical video (1080p60) wirelessly in real time, with less than 1-frame latency. It also eliminates cables and wires, removing potential tripping hazards and the need for frequent cable replacement.
