

HD 3D Video Laparoscope

Olympus

2013 ESP Award Nominee

The ENDOEYE FLEX 3D from Olympus is the world's only articulating HD 3D video laparoscope that delivers value to surgeons and patients by reducing surgical errors and improving the speed, accuracy, and precision of surgical tasks such as dissection, grasping, and suturing (compared with traditional 2D surgical systems). This is accomplished by restoring natural 3D vision and depth perception when performing laparoscopic procedures and is independent of a surgeon's skill level. Another significant advantage of the new Olympus HD 3D video platform is its availability as a module that can be easily added to an existing Olympus EVIS EXERA III Universal Imaging System. The modular design reduces the investment necessary to add 3D capability, and allows the surgeon to choose either 2D or 3D visualization from the surgical field.
