

# Care Exchange Workstations

Midmark Corporation

Midmark Corporation has enhanced its line of Care Exchange Workstations to provide highly efficient clinical workflows as physicians integrate new technology in the exam room. The new offerings include wall mounted and AC powered options. Midmark's wall mounted Care Exchange Workstations provide caregivers with the form and function of mobile units in a space-saving design ideal for healthcare environments where a mobile technology platform is not an option. They offer adjustable height monitors and keyboards in a variety of configurations. The keyboard tray can be designed to rotate up and out of the way or come toward the user an additional four inches for improved use and ergonomics. The AC powered Care Exchange Workstations support a shift up to 12 hours before needing to be recharged. Two long-lasting battery options are available, including a traditional sealed lead acid (SLA) battery or a lithium ion phosphate (LiFe) battery. The workstation features a compact base design that allows physicians to easily maneuver it between exam or patient rooms.
