

Ducharme Fracture Alignment Device

Innovative Medical Products

The Ducharme Fracture Alignment Device from Innovative Medical Products simplifies the reduction of a femoral fracture for a closed intramedullary nailing through a sterile application. The surgical device increases the leverage applied during alignment of the fracture fragments. With the improved alignment, the surgeon can more easily advance the guide wire across the reduced fracture. The lever's sliding torque lock is the device's only moving part. The IMP device also reduces radiation exposure to the surgeon's or assistant's hands and is radiolucent and autoclavable.
