

ZeroWire Ultra

NDSsi

The latest advancement of NDSsi's ultra-wideband (UWB) wireless video technology, ZeroWire Ultra allows up to nine transmitter/receiver pairs to operate simultaneously within neighboring vicinities (75-foot radius). Utilizing an innovative system of "Time Frequency Coding," ZeroWire Ultra units are programmed to change frequency bands in a specific sequence and timing, creating nine non-interfering channels, compared to the previous generation's three-channel limit. This enables a significant increase in wireless video capability for the modern OR. The ZeroWire Ultra solution also helps eliminate cables, enhance OR safety, and improve cleaning/turnaround time.
