

MatrixRIB MIPO Instrumentation

DePuy Synthes CMF

DePuy Synthes CMF, a leader in skeletal and soft tissue repair and reconstruction, announced the launch of new instrumentation that enables less invasive surgical fixation and stabilization of rib fractures with the company's MatrixRIB System of precontoured, low-profile titanium plates, locking screws and intramedullary splints. MatrixRIB Minimally Invasive Plate Osteosynthesis (MIPO) instrumentation was designed to provide surgeons with improved access, through small incisions, to rib fractures including difficult to reach sub-scapula rib fractures. The new instruments include a Trocar, Threaded Reduction Tool (TRT) with self-drilling tip, and 90-degree screwdriver with drilling capability.
