

UV Disinfection System

Steris

Steris now offers the PATHOGON UV Disinfection System, an automated, mobile system using germicidal ultraviolet light to reduce or kill pathogens on environmental surfaces. Germicidal UVC light has a proven history of reliable biocidal activity against a wide range of healthcare-associated pathogens. The PATHOGON system is designed for use as part of a complete cleaning and disinfection program, and has been shown to kill organisms such as *Clostridium difficile*, MRSA, VRE, *Acinetobacter baumannii*, *Klebsiella pneumoniae* and others. The automated cycle times range from four to twenty-five minutes, depending on the targeted organism and the size of the space being treated. The process produces no ozone or secondary contaminants, and rooms can be re-occupied immediately after treatment.
