

TELETOM Equipment Management System

Berchtold

The TELETOM Equipment Management System from Berchtold is a modular, custom-configurable boom that allows facilities to tailor its design to specific clinical environments. Clinicians make the determination for the placement of services and accessories, complementary equipment, length of arms, and positioning capabilities to optimize available space, and maximize both clinical efficiency and effectiveness. TELETOM provides the ability to adapt yet minimizes future costs due to its modular design and shared equipment mounting capability. All electric brakes provide for quiet operation, and reduce construction costs outside the OR. And TELETOM meets the exacting safety standards found in current UL KEZR & KEXS Guides.
