

HONORABLE MENTION -- HoverTech International's HT-Wedge Adjustable Positioning Device

HoverTech International

HONORABLE

MENTION -- HoverTech International's HT-Wedge Adjustable Positioning Device inflates to lift and position patients for improved visualization during intubation. The dual chamber design allows the head and chest to be adjusted separately, making it easier to achieve ear to sternal notch positioning regardless of the patient's body type. The deflated HT-Wedge can remain underneath the patient during the surgical procedure, and may then be re-inflated post-op for extubation, patient comfort or to ease breathing.
